

B (boost level)

Turn the knob clockwise to increase boost level. The amount of maximum boost depends on T and Q settings. +30 dB is the maximum amount of boost.

DC Adapter Input

Runs on 9V DC power (center pin: negative)

Q (2-way EQ curve selector)

Left for slight, right for more dramatic EQ.

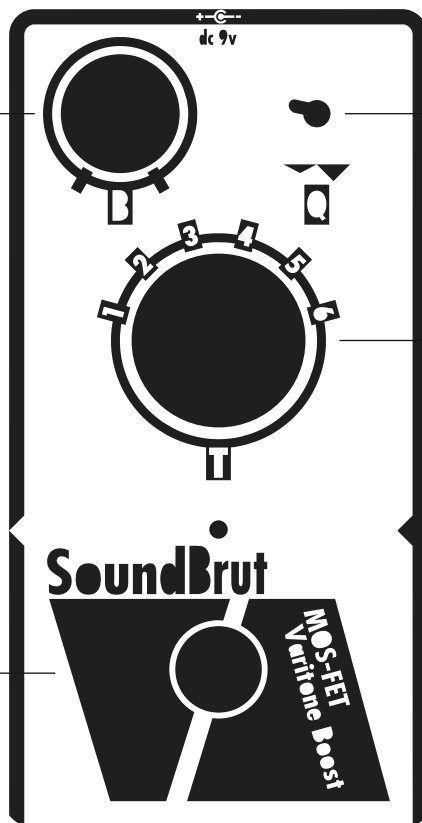

T (6-way capacitor selector)

The sound gradually gets thicker towards the 6th cap.

Output

Input

On / Off (3PDT Switch)
True bypass

Hammond enclosure

112 x 60 (mm) / 4.40 x 2.38 (Inches)

VA MOSFET Boost

VA is a MOSFET boost pedal with a custom tone stack, specifically designed to be used anywhere in your signal chain.

You can use it in front of your amp and pedals to push them into further gain stages or after your favorite dirt pedals as a tone-shaper and boost.

Our custom built and tuned Varitone circuit has a 6-way selector for 6 different capacitors. We created a system of pre/post gain stages to eliminate the notorious volume drop of the Varitone circuit. Together with a 2-way Q switch, that acts as a master EQ-depth selector for the capacitors, VA can be used as a boost pedal with 12 different tone presets.

In any setting, this pedal creates a full and well-balanced sound. Even though it is not technically a clean boost pedal, VA respectfully enhances the harmonic content of your guitar.

By keeping the boost at unity levels, the Varitone circuit adds subtle air and character to your sound; past the unity levels and with the boost turned all the way up, the pedal adds a lot of level and weight to your sound.

Mode (ex.)

Q (←) + **T** (1): Almost flat

Q (→) + **T** (6): Huge bass

Q (←) + **T** (4 to 6) + **B** (@unity): Humbucker(ish) girth

Q (→) + **T** (1 to 3) + **B** (@unity): Single(ish) bass roll-off

Q (←) + **T** (3): Nice tone
